

Creating an Eclipse-Maven Project

Prerequisite

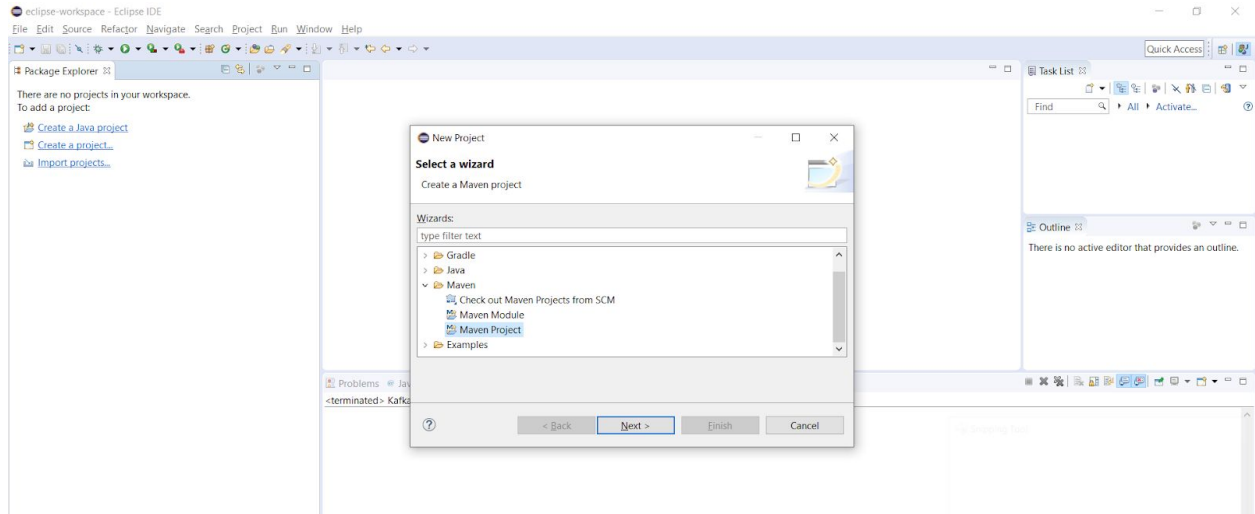

1. Make sure you have Maven plugin on your Eclipse
2. JDK 1.8 or above installed on your system.

Steps to create a new Maven Project

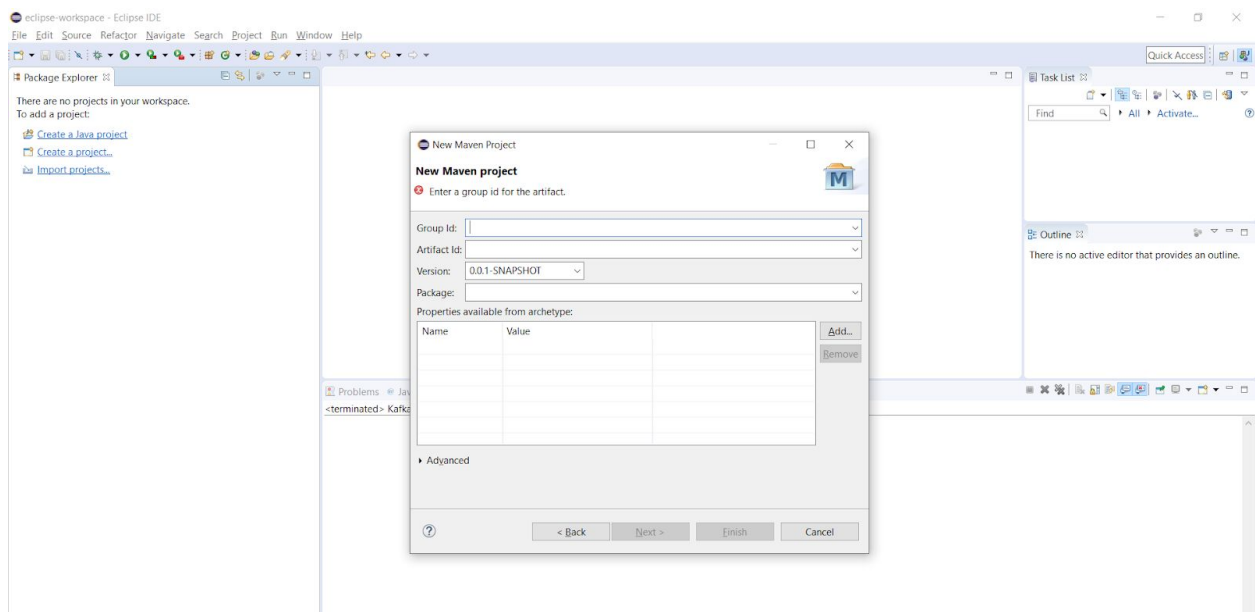

1. Open Eclipse IDE and then go to **File** → **New** → **Project**. A prompt will appear as shown below.

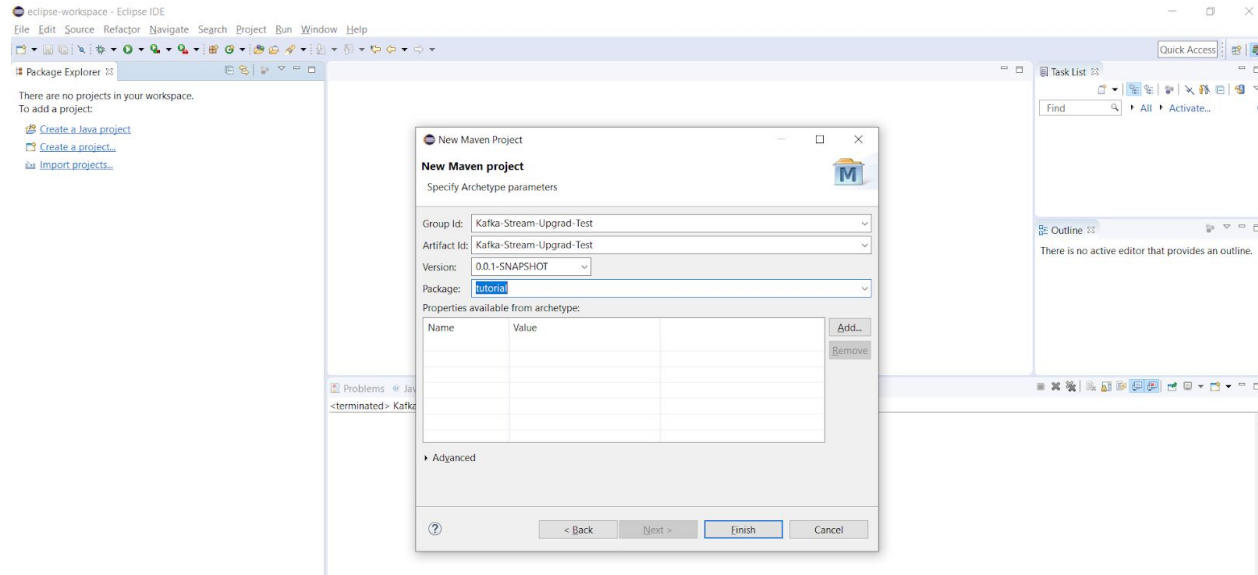

2. From the multiple options available, select the one which says **Maven** and then click on the drop-down arrow to the left of it. From the options that appear, select **Maven Project**.

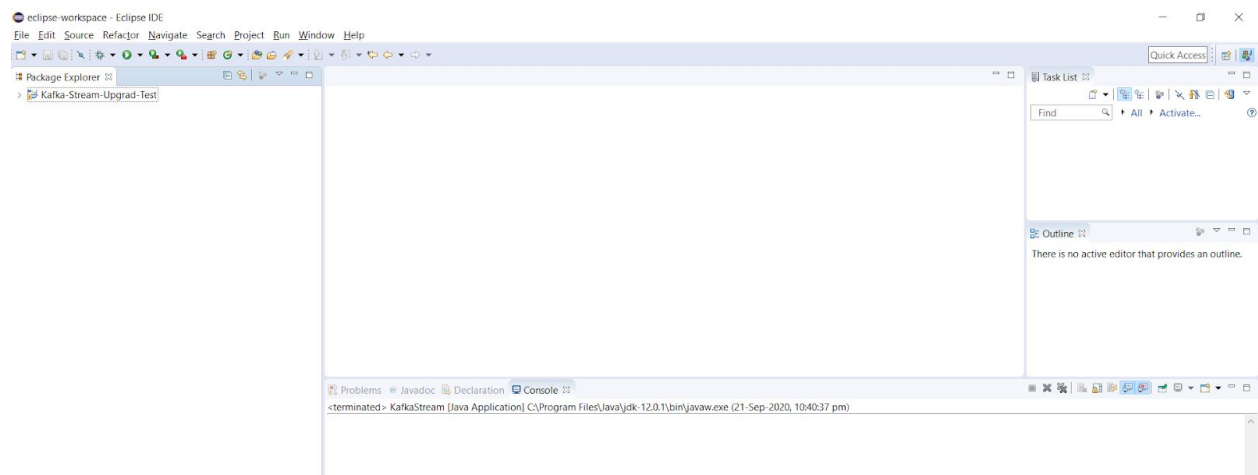

3. Then click on **Next**. Keep on clicking **Next** until you are prompted to enter the Group ID, Artifact ID and Package Name.

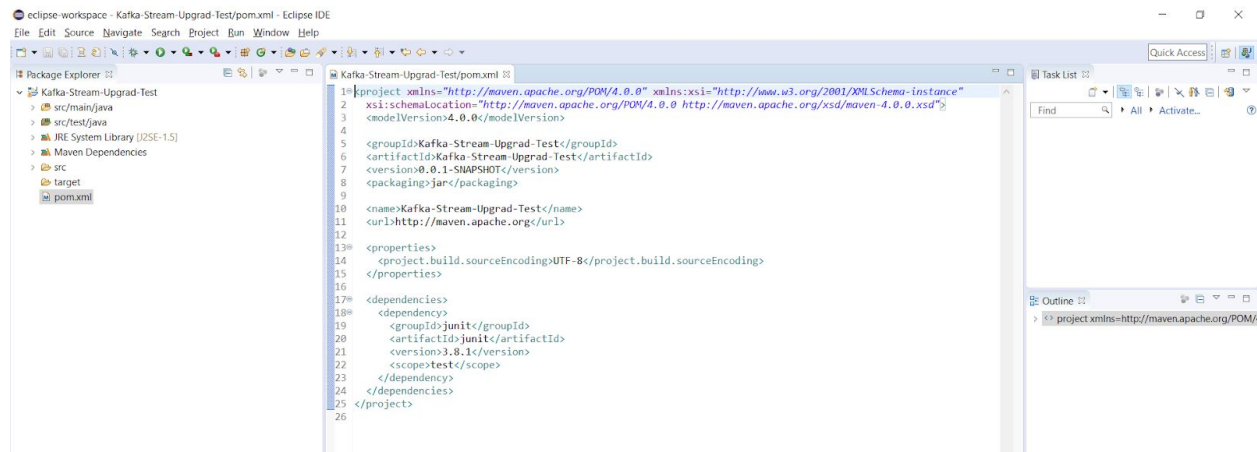

4. In the **Group ID** enter **Kafka-Stream-Upgrad-Test** and the same in the **Artifact ID**. In the Package enter **tutorial** and then click on **Finish**.

5. Once you click on Finish, the project will get created and will reflect in the **Package Explorer** as shown below.

6. Click on the drop-down arrow to the left of the project and then open the **pom.xml** file by double-clicking on it. It would appear something like this.

7. Here you need to add some properties and dependencies. Follow the next steps very carefully.
8. Insert the following between **<packaging>jar</packaging>** and **<name>Kafka-Stream-Upgrad-Test</name>** tag.

```

<properties>
  <project.build.sourceEncoding>UTF-8</project.build.sourceEncoding>
  <java-version>1.8</java-version>
  <maven.compiler.source>1.8</maven.compiler.source>
  <maven.compiler.target>1.8</maven.compiler.target>
</properties>

```

9. Once done, **delete** the following present between **<url><http://maven.apache.org></url>** and **<dependencies>** tag.

```

<properties>
  <project.build.sourceEncoding>UTF-8</project.build.sourceEncoding>
</properties>

```

10. Next, insert the following between **</dependency>** and the **</dependencies>** tag.

```

<dependency>
  <groupId>org.apache.kafka</groupId>
  <artifactId>kafka-clients</artifactId>
  <version>2.3.0</version>
</dependency>
<dependency>
  <groupId>org.apache.kafka</groupId>

```

```
<artifactId>kafka-streams</artifactId>
<version>2.3.0</version>
</dependency>
```

11. Next, enter the following between the `</dependencies>` and `</project>` tag.

```
<build>
  <plugins>
    <plugin>
      <artifactId>maven-assembly-plugin</artifactId>
      <configuration>
        <archive>
          <manifest>

<mainClass>tutorial.KafkaStream</mainClass>
          </manifest>
        </archive>
      <descriptorRefs>

<descriptorRef>jar-with-dependencies</descriptorRef>
      </descriptorRefs>
    </configuration>
    </plugin>
  </plugins>
</build>
```

12. My Final **pom.xml** looks something like this.

```
<project xmlns="http://maven.apache.org/POM/4.0.0"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
http://maven.apache.org/xsd/maven-4.0.0.xsd">
  <modelVersion>4.0.0</modelVersion>

  <groupId>Kafka-Stream-Upgrad-Test</groupId>
  <artifactId>Kafka-Stream-Upgrad-Test</artifactId>
  <version>0.0.1-SNAPSHOT</version>
  <packaging>jar</packaging>
<properties>
  <project.build.sourceEncoding>UTF-8</project.build.sourceEncoding>
```

```

    <java-version>1.8</java-version>
    <maven.compiler.source>1.8</maven.compiler.source>
    <maven.compiler.target>1.8</maven.compiler.target>
</properties>
<name>Kafka-Stream-Upgrad-Test</name>
<url>http://maven.apache.org</url>

<dependencies>
  <dependency>
    <groupId>junit</groupId>
    <artifactId>junit</artifactId>
    <version>3.8.1</version>
    <scope>test</scope>
  </dependency>

  <dependency>
    <groupId>org.apache.kafka</groupId>
    <artifactId>kafka-clients</artifactId>
    <version>2.3.0</version>
  </dependency>
  <dependency>
    <groupId>org.apache.kafka</groupId>
    <artifactId>kafka-streams</artifactId>
    <version>2.3.0</version>
  </dependency>

</dependencies>
<build>
  <plugins>
    <plugin>
      <artifactId>maven-assembly-plugin</artifactId>
      <configuration>
        <archive>
          <manifest>

<mainClass>tutorial.KafkaStream</mainClass>
          </manifest>
        </archive>
        <descriptorRefs>

<descriptorRef>jar-with-dependencies</descriptorRef>

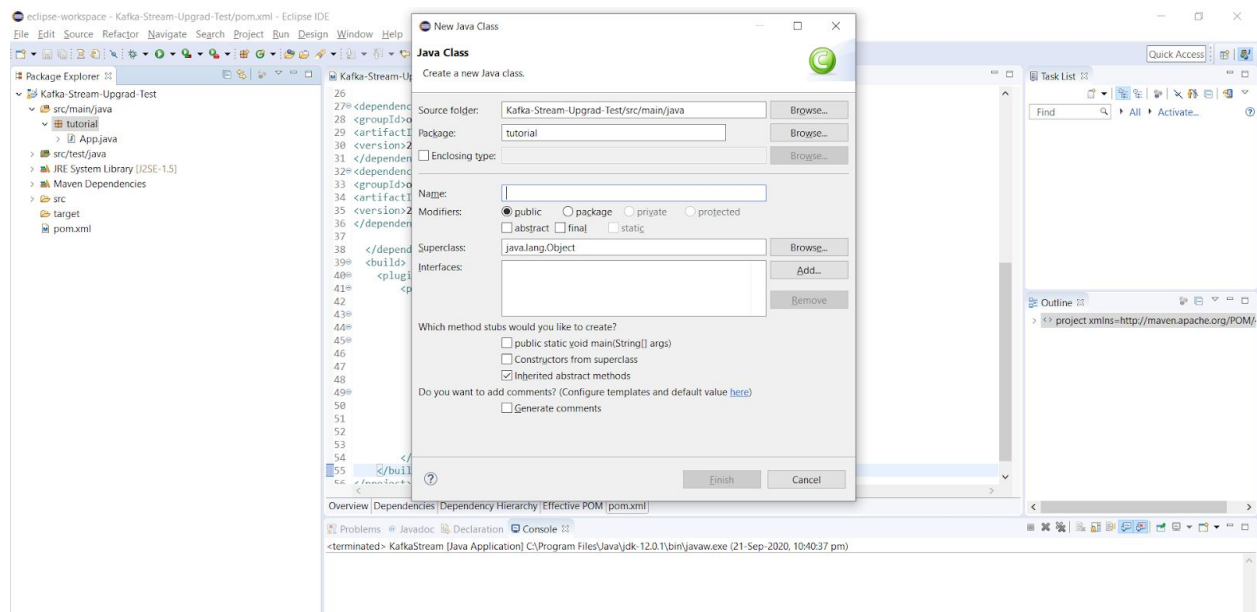

```

```

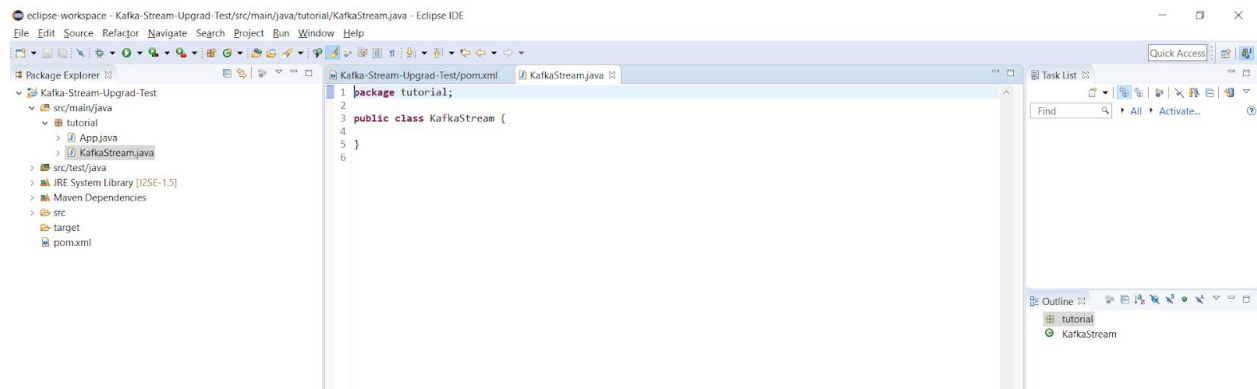

</descriptorRefs>
</configuration>
</plugin>
</plugins>
</build>
</project>

```

13. Once that is done, save the **pom.xml** file. Next, click on the drop-down arrow left to the **src/main/java**. Right click on the **tutorial** package, then select **new** and then select the **class**.

14. Name your class as **KafkaStream** and then click on **Finish**. A class with the specified name will get created in the tutorial package.

15. Inside the class create a **main** method and write your code inside it. Import the following packages. Insert the following between the line **package tutorial;** and **public class KafkaStream{**

```
import java.io.IOException;
import java.util.Map;
import java.util.Properties;

import org.apache.kafka.common.serialization.Serde;
import org.apache.kafka.common.serialization.Serdes;
import org.apache.kafka.streams.KafkaStreams;
import org.apache.kafka.streams.StreamsBuilder;
import org.apache.kafka.streams.StreamsConfig;
import org.apache.kafka.streams.kstream.KStream;
import org.apache.kafka.streams.kstream.Predicate;
import org.apache.kafka.streams.kstream.Produced;
import org.apache.kafka.streams.kstream.internals.ConsumedInternal;

import com.fasterxml.jackson.databind.ObjectMapper;
import com.fasterxml.jackson.databind.ObjectReader;
```

Once the code is written follow the steps mentioned in the document above to run the project.
